What’s Human-Computer Interaction?

Some Cognitive Psychology Basics

- The Model Human Processor
- Perception, Cognition, Motor System
- Fitts’ Law

Experiment 1

<table>

Model Human Processor

- By Stuart Card, Tom Moran, Alan Newell
- The Psychology of Human-Computer Interaction, 1983
- Basic model for perception, memory, and motor system
- Goal: estimate execution time, error rates, and training effects for simple input/output events

CMN Model

- 3 processors with associated memory
- SlowMan, MiddleMan, FastWoman

Experiment 2

- In pair, one person reads the paragraph handed out.
- Have your friend observe your eye movement.
- How does the eye move while your partner reads?

Tobii TX300

Eye Tracking

Source: Tobii
Perception

- Eye saccades: 230 ms
- Explains reading rates
  - Maximum: 13 characters/saccade  
  $\Rightarrow$ 652 words/minute

Perceptual Processor

- Stores sensor signals in visual & auditory stores
- Perception time: $\tau_p \approx 100$ ms
  - Explains Bloch's Law
    $R = I \times t$
    - $R$ is response
    - $I$ is intensity
    - $t$ is exposure time
  - Constant response for $t < 100$ms

Causality Experiment

- The animations show two billiard balls colliding, and then the still ball moving after 0, 50, or 100ms delay

Perceptual Processor

- Perception time: $\tau_p \approx 100$ ms
  - Explains animation rates (10 fps for MiddleMan)
  - Explains max. delay before causality breaks down
  - Shortens with intensity
Experiment 3

1. Digit experiment
   1. Choose 5 digits secretly from your sheet, then read them to your neighbor.
   2. Have him count backwards aloud from 50.
   3. Have him answer some other question (like what he had for dinner 3 days ago).
   4. Does he still remember the entire 5-digit sequence correctly?

2. Switch roles, repeat with 9 digits.

3. Finally, switching roles again, read the long sequence of numbers to your neighbor, stopping somewhere suddenly. See how many of the last numbers he can repeat immediately.

Cognitive System

- Chunks depend on user & task
- Working memory:
  - Capacity: $\mu_{WM} = 7 \pm 2$ chunks (Miller’56)
  - Half life: $\delta_{1,WM} = 73$ s (1 chunk)
  $\delta_{3,WM} = 7$ s (3 chunk)
- Visual/acoustic encoding

- Long-term memory:
  - Infinite capacity and half life
  - Semantic encoding (associations)
  - Fast read, slow write

$\Rightarrow$ Remembering items maxes out at 7 s/chunk learning speed (1 pass)

- Cognitive processor:
  - Processing time $T_C = 70$ ms
**Experiment 4**

- **Experiment**: 5 s of strokes between lines. Try to reach both lines.
- **Count number of reversals**
  - How many milliseconds per reversal?
- **Create a contour of stroke bottoms, count number of corrections**
  - How many milliseconds per correction?

![Graph showing 34 reversals per side and 10 corrections per side, totaling 68 reversals and 20 corrections.](image)

**Motor System**

- **Motor processor (open loop)**
  - $\tau_M = 70$ ms
  - Average time between each reversal

![Diagram of the motor processor with a time of 70 ms.](image)

- **Closed loop**:
  - $\tau_p + \tau_c + \tau_M = 240$ ms
  - Average time between each correction

![Diagram of the closed loop system with a time of 240 ms.](image)
**Motor System: Fitts’ Law**

- **Goal:** Predict time to press buttons (physical or on-screen) as function of distance and size

- **Result (Fitts, 1954):** \( T_{\text{pos}} = I_M \times I_D \)
  - \( T_{\text{pos}} \): time to reach button
  - \( I_M = 100 \text{ ms/bit} \): index of movement, constant
  - \( I_D = \log_2(2D/W) \): index of difficulty, in bits

**Deriving Fitts’ Law from CMN**

- \( D_i \): remaining distance to target after \( i \)th movements,

  \[ D_i = \epsilon \times D \]

  \[ D_2 = \epsilon \times D_1 = \epsilon^2 \times D \]

  \[ D_n = \epsilon \times D_{n-1} = \epsilon^n \times D \]

  (hand reaches target after \( n \) movements)

\[ \epsilon = \frac{D_i}{D_{i-1}} < 1 \]

**Tapping Task Results**

(Experiment 1)

<table>
<thead>
<tr>
<th>Distance (cm)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Same with .5cm and 2cm wide strips Tap for 10s, count taps afterwards</td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
</tbody>
</table>

- Doubling the distance adds roughly a constant to execution time
  \( \Rightarrow \) indicates logarithmic nature

- Doubling the target width gives about same results as halving the distance
  \( \Rightarrow \) indicates connection of \( D/W \) in formula
### Deriving Fitts’ Law from CMN

\[ e = 0.07 \]
\[ e^n \cdot D \leq \frac{W}{2} \]

- Solve for \( n \)
  \[ \epsilon^n \cdot D \leq \frac{W}{2} \]
  \[ \epsilon^n \leq \frac{W}{2D} \]
  \[ n \geq \frac{\log_2 \frac{W}{2D}}{\log_2 \epsilon} \]
  \[ n \geq -\frac{\log_2 \frac{2D}{W}}{\log_2 \epsilon} \]

- Positioning for \( n \) times
  \[ T_{pos} = (t_p + t_c + t_m) \cdot n \]
  \[ = 240 \cdot n \]
  \[ \geq 240 \cdot \frac{-\log_2 \frac{2D}{W}}{\log_2 \epsilon} \]
  \[ \geq -240 \cdot \frac{\log_2 \epsilon}{\log_2 \frac{2D}{W}} \]
  \[ \approx 100 \text{ ms/bit} \cdot \frac{\log_2 \frac{2D}{W}}{\log_2 \epsilon} \]

- \( T_{pos} \) in \( \text{s} \)

### Visualizing Fitts’ Law

**Experiment:** fixed distance \( D \), varying width \( W \)

\[ T_{pos} = I_M \cdot \log_2 \left( \frac{2D}{W} + \frac{1}{2} \right) \]

**Target Width**

- Welford’s Formulation, 1968:
  \[ T_{pos} = I_M \cdot \log_2 \left( \frac{D}{W} + \frac{1}{2} \right) \]

- Shannon’s Formulation, ISO, 80’s:
  \[ T_{pos} = a + b \cdot \log_2 \left( \frac{D}{W} + 1 \right) \]

\( a, b \) depend on device, determine experimentally

Use \( a = 0 \text{ ms}, b = I_d = 100 \text{ ms} \) for quick and dirty estimates

Improved curve fit, no negative times for infinite-size targets

**More in the assignment**
Exercise: Mobile Phone

- How much faster does calling become by moving the “call” button from 35 mm distance to 15 mm distance, measured from the middle of the keypad? The size of the call button is 10 x 10 mm
- Welford’s Law: \( T_{pos} = I_M \cdot \log_2 \left( \frac{D}{W} + \frac{1}{2} \right) \)
- Use \( I_M = 100 \text{ ms/bit} \)

Solution

\[
T_{pos1} = I_M \cdot \log_2 \left( \frac{D_1}{W} + \frac{1}{2} \right)
\]
\[
T_{pos2} = I_M \cdot \log_2 \left( \frac{D_2}{W} + \frac{1}{2} \right)
\]
\[
T_{pos1} - T_{pos2} = I_M \cdot \left( \log_2 \left( \frac{D_1}{W} + \frac{1}{2} \right) - \log_2 \left( \frac{D_2}{W} + \frac{1}{2} \right) \right)
= 100 \text{ ms/bit} \cdot \left( \log_2 \left( \frac{35}{10} + \frac{1}{2} \right) - \log_2 \left( \frac{15}{10} + \frac{1}{2} \right) \right) \text{ bit}
= 100 \text{ ms} \cdot (\log_2 4 - \log_2 2)
= 100 \text{ ms} \cdot (2 - 1)
= 100 \text{ ms}
\]

⇒ Moving the call button speeds up each call by an average of about 100ms.

When to Evaluate

\[ \text{Design} \rightarrow \text{Analyze} \rightarrow \text{Implement} \]

Evaluate with or without users

Theory
- ✓ Models of interaction
- ✓ Affordances, mappings, constraints, types of knowledge, errors
- ✓ Design principles
- ⇒ Human cognition and performance
- • History and vision of HCI

Practice
- ✓ Sketching
- ✓ User observation
- ✓ Iterative design
- ✓ Prototyping
- ✓ Ideation
- ⇒ User study and evaluation
Why Evaluate?

- To ensure that system matches user needs
- Necessary even if design was already user-centered (interviews, …)!
- Evaluation should happen throughout the entire software development process
  - Early designs are more often evaluated by design team, analytically and informally
  - Later implementations are more often evaluated by users, experimentally and formally

Why Evaluate?

- To judge system features
  - Does it facilitate users’ tasks?
  - Does it offer the right features, easy to reach, and presented as expected!
- To judge effects on users
  - How easy to learn and use is the system?
  - How do users feel about the system?
  - Are there areas that overload users?
- To discover specific problems
  - Do unexpected/confusing situations come up?

Where to Evaluate: Lab

- With or without users
  + Equipment (A/V, see-through mirrors, special computers), no disruptions, quiet
  - Natural environment missing (shelves, wall calendar, …); unnatural situation (relevance?)
- Only place possible if real use dangerous, remote (ISS), or controlled situation needed

Where to Evaluate: In The Field

- Studies in the users’ natural environment
  + More realistic (also because of disruptions)
  + Situations and behavior more natural
  + Better suited to long-term studies
  - Noise, task interruptions
  - Will still feel like a test situation
Participatory Design

- Involve user as part of design team throughout entire software process
- Originated in Scandinavia where it is the law for certain products
- Techniques for team communication
  - Brainstorming, storyboarding, workshops, interviews, role plays, paper prototypes
- Problems
  - High effort, conflicts with client hierarchies, user conversion

E1: Literature Review

- Many research results about user interface design have been published
- Idea: Search literature for evidence for (or against) aspects of your design
- Saves own experiments
- Results only carry over reliably if context (users, assumptions) is very similar

E2: Cognitive Walkthrough

- Without users
- Expert = designer or cognitive psychologist
- Goal: Judge learnability and ease of use
- Step through each task and ask
  - How does interaction influence user?
  - What cognitive processes will she need?
  - What problems could learning/doing this step have?
- Does system help user to get from goals to intentions and actions?
- Requires interface description, task description, and user profile

Evaluation Techniques

Evaluating Without Users
- E1 Literature Review
- E2 Cognitive Walkthrough
- E3 Heuristic Evaluation
- E4 Model-Based Evaluation (GOMS,...)

Evaluating With Users
- Qualitative
  - E5 Model Extraction
  - E6 Silent Observation
  - E7 Think Aloud
  - E8 Constructive Interaction
  - E9 Retrospective Testing
- Quantitative
  - E10 Controlled Experiments
  + Interviews, questionnaires,...
E2: Cognitive Walkthrough

- What to do:
  - Choose task—describe goals—determine actions
  - Analyze this decision process using above questions
- Question forms capture psychological knowledge and guide the tester
- Analytical method for early design or existing systems
- Takes time

E3: Heuristic Evaluation

- Variant of Cognitive Walkthrough
- Choose usability heuristics
  - General guidelines, e.g., Nine Golden Rules
- Step through tasks and check whether guidelines are followed
  - Quick and cheap
  - Subjective
  - Better done by several independent designers

E4: Model-Based Evaluation

- Some models exist that offer a framework for design and evaluation
- Examples:
  - Information efficiency
  - GOMS, KLM
  - Design Rationale (History of design decisions with reasons and alternatives)
  - Design Patterns

Evaluation Techniques

Evaluating Without Users
- E1 Literature Review
- E2 Cognitive Walkthrough
- E3 Heuristic Evaluation
- E4 Model-Based Evaluation (GOMS,...)

Evaluating With Users
- E5 Model Extraction
- E6 Silent Observation
- E7 Think Aloud
- E8 Constructive Interaction
- E9 Retrospective Testing
- E10 Controlled Experiments

+ Interviews, questionnaires,...
